

Identify User Risk & Stop Incidents Before They Start

Your Problem:

Users are the most targeted and least protected link in your security program. Unintentional insider risk is at the root of the majority of incidents that are overwhelming your security teams. Phishing, malware and ransomware tactics are focused on tricking unsuspecting users. But how can you safeguard those users if you don't know who they are?

Our Solution:

Elevate finds that 4% of users cause 80% of phishing incidents and 3% of users cause 92% of malware incidents. Elevate identifies and responds proactively to your organization's highest risk users, providing security teams with the visibility and risk scoring necessary to zero in on the most likely source of the next security incident, and stop it before it starts.

Take Action on User Risk Without Killing Productivity

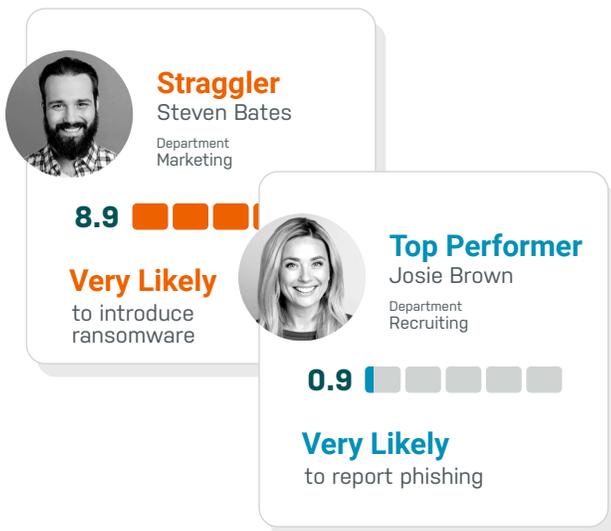

Identify Your Riskiest Users

Elevate creates a heatmap of your riskiest users through a feed of data from your existing identity, email, device, web, and other security tools. A comprehensive profile and history of behaviors impact the risk profile of each user based on:

- Actions:** clicking links, downloading malware, etc.
- Attackability:** likelihood of the user being targeted
- Access level:** the value of assets accessible to each user

“Elevate Security risk analytics provides our management with “Heat Map” visibility to high-risk users with the ability to drill down to specific business risks. This level of actionable insight is extremely valuable in assessing security risk and defining our corporate strategy.”

— VP, Global Security Risk Operations

to report phishing

Proactively Secure Your Workforce

Lower your risk profile by embedding individual user risk profiles into your daily operations with:

- Playbooks** for targeted, adaptive controls and policies
- Risk scoring** to enhance existing tools and strategies, like Zero Trust

Elevate brings laser focus to the specific guardrails essential to protecting your most valuable assets from accidental exposure, while also showing where controls may be safely relaxed.

Pinpoint User Risk & Shift Left of Compromise

Elevate identifies and responds proactively to an organization's riskiest users, providing security teams with the visibility and playbooks necessary to prevent the next security breach.

How Elevate Security Works

Unprecedented Visibility

Elevate offers dozens of built-in integrations with your existing tooling to develop user profiles essential to risk prioritization. Unique, dynamic risk scores are developed with data from each user's historical actions, access level to sensitive data and likelihood of being attacked.

Automated Playbooks

Out-of-the-box and customizable playbooks are designed to respond to almost any user-based risk. Our reputation service alerts on individual user risk and puts a wide variety of targeted actions at your disposal. Risk intelligence insights can easily be shared with other systems, such as ServiceNow and Splunk.

Customized Feedback

Communication workflows provide personalized, direct, near real-time feedback based on user actions to inform individuals of the security impact of their actions.

Embedded User Risk Intelligence

Security teams and technologies are constantly making decisions on user risk without in-depth knowledge. Embed our risk score into IAM, IR processes and other tooling to make smarter decisions.

Differentiated Security

Adjust security controls to match each user's specific risk profile. By automating these policies your security team can ensure that their identity, endpoint and email controls are tuned commensurate with risk.

Drive improved behavior for your riskiest users and dramatically reduce the aggregate risk profile of your entire organization.
