

Elevate Control

Automate SecOps Controls & Response to High-Risk Users

Research finds that a small percentage of employees contribute to the majority of an organization's security incidents. Defending against cyber threats is difficult enough without your own workforce contributing to the assault. Poor behaviors by high-risk users end up consuming valuable resources desperately needed to fight real adversaries. Amplifying the problem, there's no reliable method to pinpoint these users in order to facilitate the response and controls required to minimize their risk.

Elevate Security solves this problem by helping you identify who is most 'at-risk' and automate your response to that risk, significantly reducing internal-driven security incidents.

The **Control** package of Elevate injects user risk intelligence into security operations tools (SIEM, SOAR, Case Management) to inform control policy protections, automate safeguards, and speed decision making. Let's look closer!

Elevate ingests & analyzes data from your enterprise to identify and score individual risk based on behaviors and attack history

Elevate injects user risk data into SecOps systems to inform policies and controls for automating analysis and response to human risk behaviors and patterns

USE CASE: Walter, a risky user

Developer w/source code access
Recently downloaded malware
Browsed to sites he shouldn't
Clicked on phishing links

Elevate Control helps you reduce burdens on your SecOps teams for employees like Walter. Given his role and actions that exceed his risk threshold, e.g., clicking on phishing links, Elevate will automatically add him to a 'high-risk' group. In turn, Walter's future actions will be subject to email security policies which have stricter requirements around what email is quarantined, what attachment protection is in place, and what URL protection is enabled.

Improve security behavior & awareness with Elevate Engage

— Learn more about <u>driving measurable behavior change</u>

Enhance & streamline security operations (SecOps)

- Add to 'High-Risk' watch list; share with other security functions
- Integrate risk data into Help Desk/SecOps workflows; existing tooling, e.g., email/web gateways, endpoint detection & response

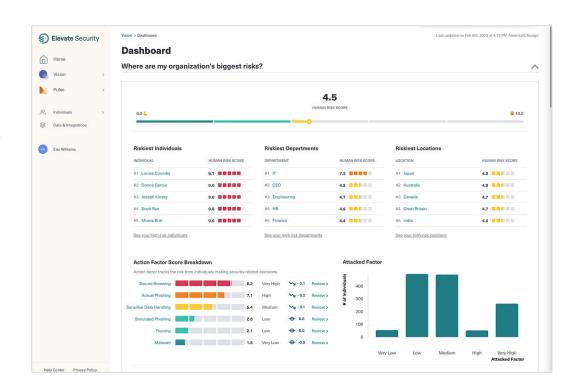

Strengthen critical asset defense with Elevate Identity

— Learn more about <u>protecting access to critical assets</u>

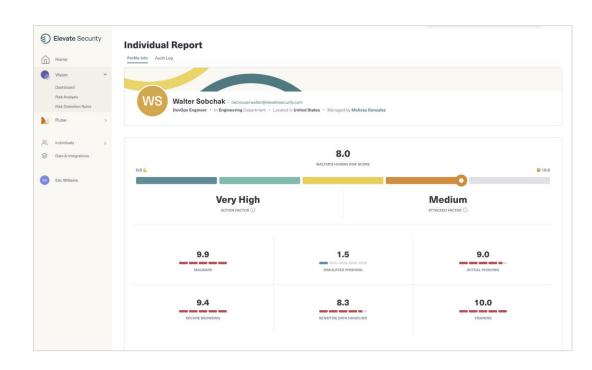

Elevate Control injects workforce risk intelligence into your security operations, including Security Information and Event Management (SIEM), Security Orchestration, Automation and Response (SOAR), and help desk tools, to accelerate incident triage and response, enable better help desk decision making, and automate controls for your riskiest individuals.

The Elevate Vision
Dashboard details riskiest
individuals, departments &
locations, as well as the
factors driving human risk

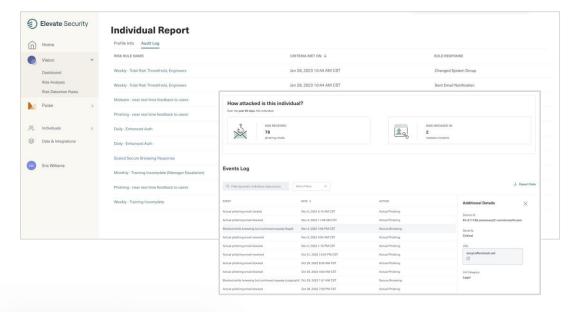

Help Desk and security analysts have user risk information at their fingertips, providing the insights needed to approve or deny requests of a sensitive nature

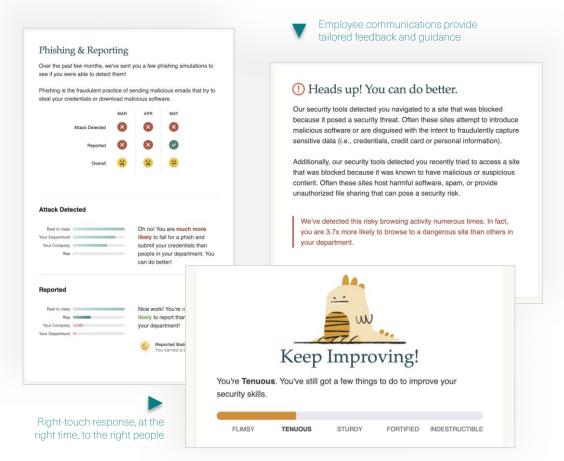

Elevate identifies user risk behaviors related to phishing, malware, bad browsing, and unsafe data handling along with attack frequency and severity

DYNAMIC RISK RESPONSE

Change awareness & behaviors through personalized education, gamification, and friendly touch points to reinforce good security judgement

SEE A DEMO

Elevate Control helps you reduce security operations burdens by injecting human risk data into security policies, controls, and workflows. You'll speed incident analysis and response while gaining control and visibility of your riskiest users.
